

hyperSpec Plotting functions

Claudia Beleites <cbeleites@units.it>
CENMAT, DMRN, University of Trieste

February 1, 2011

Vignette under Development

This file is currently undergoing a thorough revision. Changes may happen frequently.

Reproducing the Examples in this Vignette

All spectra used in this manual are installed automatically with *hyperSpec*.
Note that some definitions are executed in `vignette.defs`, and others invisibly at the beginning of the file in order to have the code as similar as possible to interactive sessions.

Contents

11.1 <code>spc.identify</code> : finding out wavelength, intensity and spectrum	19
11.2 <code>map.identify</code> : finding a spectrum in a map plot	19
11.3 Related functions provided by base graphics and <i>lattice</i>	19
11.4 Interactively changing graphics	19

Suggested Packages

latticeExtra: `panel.levelplot.points` and `plotvoronoi` replaced.

deldir: available

rgl: available

ggplot2: available

In addition *tripack*, *playwith*, and *latticeist* are discussed, but not needed for calculations.

Preliminary Calculations

For some plots of the `chondro` dataset, the pre-processed spectra are preferred, and their cluster averages \pm one standard deviation:

```
> chondro.preproc <- chondro - spc.fit.poly.below (chondro)

Fitting with npts.min = 15

> chondro.preproc <- sweep (chondro.preproc, 1, mean, "/")
> chondro.preproc <- sweep (chondro.preproc, 2, apply (chondro.preproc, 2, quantile, 0.05), "--")
> cluster.cols <- c ("dark blue", "orange", "#C02020")
> cluster.meansd <- aggregate (chondro.preproc, chondro$clusters, mean_pm_sd)
> cluster.means <- aggregate (chondro.preproc, chondro$clusters, mean)
```

For details about the pre-processing, please refer to the vignette `vignette ("chondro")`, or the help `? chondro`.

1 Predefined functions

hyperSpec comes with 5 major predefined plotting functions.

`plot` main switchyard for most plotting tasks

`levelplot` *hyperSpec* has a `levelplot` method

`plotspc` plots spectra

`plotc` calibration plot, time series, depth profile
`plotc` is a *lattice* function

`plotmap` more specialized version of `levelplot` for map or image plots.
`plotmap` is a *lattice* function

`plotvoronoi` more specialized version of `plotmap` that produces Voronoi tessellations.
`plotvoronoi` is a *lattice* function

gg

plotspc

plots the spectra, i.e. the intensities `$spc` over the wavelengths `@wavelength`.

```
> plotspc (paracetamol)
```

gg

plotc

plots an intensity over a single other data column, e.g.

- calibration
- time series
- depth profile

```
> plotc (flu)
```

gg

levelplot

plots a false colour map, defined by a formula.

```
> levelplot ( spc ~ x * y, chondro, aspect = "iso")
```

Warning: Only first wavelength is used for plotting

gg

plotmap

plotmap is a specialized version of levelplot. It uses a single value (e.g. average intensity or cluster membership) over two data columns (default `$x` and `$y`)

```
> plotmap (chondro)
```

gg

plotvoronoi

Function plotvoronoi not available:
package latticeExtra and deldir needed.

plotmap is a specialized version of levelplot. It uses a single value (e.g. average intensity or cluster membership) over two data columns (default `$x` and `$y`)

```
> plotvoronoi (sample (chondro, 300), clusters ~ x * y)
NULL
```

2 Arguments for plot

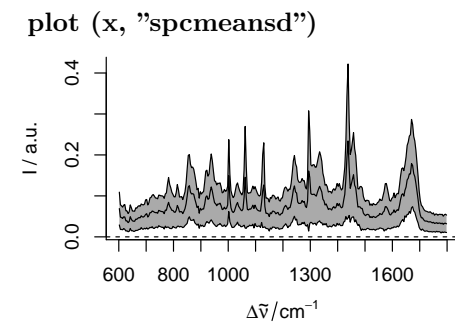

hyperSpec's `plot` method uses its second argument to determine which of the specialized plots to produce. This allows some handy abbreviations. All further arguments are handed over to the function actually producing the plot.

gg

is equivalent to `plotspc (flu)`
`> plot (flu, "spc")`

gg

plots mean spectrum ± 1 standard deviation
`> plot (chondro.preproc, "spcmeansd")`

gg

plot (x, "spcprctile")

plots median, 16th and 84th percentile for each wavelength. For Gaussian distributed data, 16th, 50th and 84th percentile are equal to mean \pm standard deviation. Spectroscopic data frequently are not Gaussian distributed. The percentiles give a better idea of the true distribution. They are also less sensitive to outliers.

> plot (chondro.preproc, "spcprctile")

gg

plot (x, "spcprct15")

like "spcprct1" plus 5th and 95th percentile.

> plot (chondro.preproc, "spcprct15")

gg

plot (x, "c")

> plot (flu, "c")

is equivalent to plotc (flu)

gg

plot (x, "ts")

plots a time series plot

> plot (laser [, , 405], "ts")

equivalent to plotc (laser, spc ~ t)

gg

plot (x, "depth")

gg

plot (x, "mat")

gg

plot (x, "map")

gg

plot (x, "voronoi")

Function plotvoronoi not available:
package latticeExtra and deldir needed.

plots a depth profile plot

```
> depth.profile <- new ("hyperSpec",
+   spc = as.matrix (rnorm (20) + 1:20),
+   data = data.frame (z = 1 : 20),
+   label = list (spc = "I / a.u.",
+     z = expression (`\` (z, mu*m)),
+     .wavelength = expression (lambda)))
> plot (depth.profile, "depth")
the same as plotc (laser, spc ~ z)
```

plots the spectra matrix.

```
> plot (laser, "mat")
Equivalent to
> levelplot (spc ~ .wavelength * .row, laser)
```

is equivalent to plotmap (chondro)

```
> plot (chondro, "map")
```

```
> plot (sample (chondro, 300), "voronoi")
```

See plotvoronoi

3 Spectra

plotspc

plotspc offers a variety of parameters for customized plots. To plot ...

gg

particular wavelength range

if only one wavelength range is needed, the extract command is handiest:

```
> plotspc (paracetamol [, 700 ~ 1200])
```

If `wl.range` already contains indices: use `wl.index = TRUE`.

gg

more wavelength ranges

use `wl.range = list (600 ~ 1800, 2800 ~ 3100)`. Cut the wavelength axis appropriately with `xoffset = 750`

```
> plotspc (paracetamol,
+         wl.range = c (300 ~ 1800, 2800 ~ max),
+         xoffset = 750)
```

If available, the package *plotrix*[\[1\]](#) is used to produce the cut mark.

gg

with reversed abscissa

use `wl.reverse = TRUE`

```
> plotspc (paracetamol, wl.reverse = TRUE )
```

gg

in different colours

use `col = vector.of.colours`

```
> plotspc (flu, col = matlab.dark.palette (6))
```

gg

dots instead of lines

```
use lines.args = list (pch = 20, type = "p")
> plotspc (paracetamol [, 2800 ~ 3200],
+         lines.args = list (pch = 20, type = "p"))
```

gg

mass spectra

```
use lines.args = list (type = "h")
> plot (barbituates [[1]], lines.args = list (type = "h"))
```

gg

more spectra into an existing plot

```
use add = TRUE
> plotspc (chondro [ 30,,])
> plotspc (chondro [300,,], add = TRUE, col = "blue")
```

gg

Summary characteristics

func may be used to calculate summary characteristics prior to plotting. To plot e.g. the standard deviation of the spectra, use:

```
> plotspc (chondro, func = sd)
```

gg

with different line at $I = 0$

zeroline takes a list with parameters to *abline*, NULL suppresses the line.

```
> plotspc (paracetamol,
+         zeroline = list (col = "red"))
```

gg

adding to a spectra plot

plotspc uses base graphics. After plotting the spectra, more content may be added to the graphic by *abline*, *lines*, *points*, etc.

```
> plot (laser, "spcmeansd")
> abline (v = c(405.0063, 405.1121, 405.2885, 405.3591),
+        col = c("black", "blue", "red", "darkgreen"))
```

3.1 Stacked spectra

gg

stacked

use *stacked = TRUE*

```
> plotspc (cluster.means,
+         col = cluster.cols,
+         stacked = TRUE)
```

gg

Stacking groups of spectra

The spectra to be stacked can be grouped: *stacked = factor*. Alternatively, the name of the grouping extra data column can be used:

```
> plot (cluster.meansd,
+       stacked = ".aggregate",
+       fill = ".aggregate",
+       col = cluster.cols)
```

gg

Manually giving yoffset

gg

Dense stacking

gg

Elaborate example

Stacking values can also be given manually as numeric values in *yoffset*:

```
> plotspc (cluster.meansd,
+         yoffset = rep (0:2, each = 3),
+         col = rep (cluster.cols, each = 3))
```

To obtain a denser stacking:

```
> yoffsets <- apply (cluster.means [[]], 2, diff)
> yoffsets <- - apply (yoffsets, 1, min)
> plot (cluster.means, yoffset = c (0, cumsum (yoffsets)),
+       col = cluster.cols)
```

```
> yoffset <- apply (chondro.preproc, 2, quantile, c(0.05, 0.95))
> yoffset <- range (yoffset)
> plot(chondro.preproc[1],
+      plot.args = list (ylim = c (0, 2) * yoffset),
+      lines.args = list( type = "n"))
> yoffset <- (0:1) * diff (yoffset)
> for (i in 1 : 3){
+   plot(chondro.preproc, "spcprct15", yoffset = yoffset [i],
+       col = "gray", add = TRUE)
+   plot (chondro.preproc [i], yoffset = yoffset [i],
+       col = matlab.dark.palette (3) [i], add = TRUE,
+       lines.args = list (lwd = 2))
+ }
```

4 Calibration Plots, (Depth) Profiles, and Time Series Plots

plotc

4.1 Calibration plots

gg

Intensities over concentration

Plotting the Intensities of one wavelength over the concentration for univariate calibration:

```
> plotc (flu [, , 450])
```

The default is to use the first intensity only.

gg

Summary Intensities over concentration

A function to compute a summary of the intensities before drawing can be used:

```
> plotc (flu, func = range, groups = .wavelength)
```

If `func` returns more than one value, the different results are accessible by `.wavelength`.

gg

Conditioning: plotting more traces separately

```
> plotc (flu [, , c (405, 445)], spc ~ c | .wavelength,
+       cex = .3, scales = list (alternating = c(1, 1)))
```

gg

Grouping: plot more traces in one panel

```
> plotc (flu [, , c (405, 445)], groups = .wavelength)
```

gg

Changing Axis Labels (and other parameters)

gg

Arguments for `xyplot` can be given to `plotc`:

```
> plotc (flu [, 450],
+       ylab = expression (I ["450 nm"] / a.u.),
+       xlim = range (0, flu$c + .01),
+       ylim = range (0, flu$spc + 10),
+       pch = 4)
```

Adding things to the plot: customized panel function

As `plotc` uses the *lattice* function `xyplot`, additions to the plot must be made via the panel function:

```
> panelcalibration <- function (x, y, ..., clim = range (x), level = .
+   panel.xyplot (x, y, ...)
+   lm <- lm (y ~ x)
+   panel.abline (coef (lm), ...)
+   cx <- seq (clim [1], clim [2], length.out = 50)
+   cy <- predict (lm, data.frame (x = cx),
+                 interval = "confidence",
+                 level = level)
+   panel.lines (cx, cy [,2], col = "gray")
+   panel.lines (cx, cy [,3], col = "gray")
+ }
> plotc (flu [, 450], panel = panelcalibration,
+       pch = 4, clim = c (0, 0.35), level = .99)
```

4.2 Time series and other Plots of the Type Intensity-over-Something

gg

Abscissae other than c

Other abscissae may be specified by explicitly giving the model formula:

```
> plotc (laser [, c(405.0063, 405.1121, 405.2885, 405.3591)],
+       spc ~ t,
+       groups = .wavelength,
+       type = "b",
+       col = c ("black", "blue", "red", "darkgreen"))
```

5 Levelplot

hyperSpec's `levelplot` can use two special column names:

`.wavelength` for the wavelengths

`.row` for the row index (i.e. spectrum number) in the data

Besides that, it behaves exactly like *levelplot*. Particularly, the data is given as the *second* argument:

gg

levelplot

gg

factors as z

If the colour-coded value is a factor, the display is adjusted to this fact:

```
> levelplot (clusters ~ x * y, chondro)
```

6 Spectra Matrix

It is often useful to plot the spectra against an additional coordinate, e.g. the time for time series, the depth for depth profiles, etc.

This can be done by `plot (object, "mat")`. The actual plotting is done by `levelplot`, so the plots can be grouped or conditioned.

gg

different palette

gg

different y axis

gg

Changing the y axis is only possible with levelplot:

```
> levelplot (spc ~ .wavelength * t, laser)
```

colour-coded points: different panel function

gg

```
> barb <- do.call (collapse, barbituates[1:50])
> barb <- orderwl (barb)
> levelplot (spc ~ .wavelength * z, barb,
+           panel = panel.levelplot.points,
+           cex = .33, col.symbol = NA,
+           col.regions = matlab.palette)
```

contour lines

Contour lines may be added to all levelplot based plots:

```
> plot (flu, "mat",
+       contour = TRUE,
+       labels = TRUE,
+       col = "#00000080",
+       at = seq (0, 700, by = 50))
```

7 False-Colour Maps: plotmap

plotmap uses levelplot, a *lattice* function. Therefore, in loops, functions, Sweave chunks, etc. the lattice object needs to be printed explicitly by `print (plotmap (object))` ([R FAQ: Why do lattice/trellis graphics not work?](#)).

plotmap is a specialized version of levelplot. The spectral intensities may be summarized by a function before plotting (default: `mean`). The same scale is used for x and y axes (`aspect = "iso"`).

gg

plotting map

```
> plotmap (chondro)
```

gg

plotting maps with other than x and y

specify the colour-coded variable, abscissa and ordinate as formula: `colour.coded ~ abscissa * ordinate`

```
> plotmap (chondro, spc ~ y * x)
```

gg

colour-coded factors

```
> plotmap (chondro, clusters ~ x * y)
```

If the colour-coded variable is a factor, each level gets its own colour, and the legend is labeled accordingly.

gg

different palette

To plot with a different palette, use `trellis.args= list (col.regions = palette)`.

```
> print (plotmap (chondro, clusters ~ x * y,  
+           col.regions = cluster.cols))
```

gg

defined wavelengths

gg

To plot a map with particular wavelengths use this:

```
> plotmap (chondro.preproc [, , c(728, 782, 1098,
+                               1240, 1482, 1577)],
+          col.regions = matlab.palette)
```

Conditioning

gg

```
> plotmap (chondro,
+          spc ~ y * x | x > 5,
+          col.regions = matlab.palette(20))
```

Conditioning on .wavelength

gg

plotmap automatically applies the function in *func* before plotting. This defaults to the *mean*. In order to suppress this, use *func = NULL*. This allows conditioning on the wavelengths.

To plot e.g. the first two score maps of a principal component analysis:

```
> pca <- prcomp (~ spc, data = chondro.preproc$.)
> scores <- decomposition (chondro, pca$x,
+                          label.wavelength = "PC",
+                          label.spc = "score / a.u.")
> plotmap (scores [, , 1:2],
+          spc ~ y * x | as.factor(.wavelength),
+          func = NULL,
+          col.regions = matlab.palette(20))
```

Conditioning on .wavelength II

gg

Alternatively, use *levelplot* directly:

```
> levelplot (spc ~ y * x | as.factor(.wavelength),
+           scores [, , 1:2],
+           aspect = "iso",
+           col.regions = matlab.palette(20))
```

Voronoi plot

Function `plotvoronoi` not available:
package `latticeExtra` and `deldir` needed.

```
> plotvoronoi (sample (chondro, 300), clusters ~ x * y,
+             col.regions = matlab.palette(20))
NULL
```

Voronoi uses `panel.voronoi` from *latticeExtra*[2]. The tessellation is calculated by default using *deldir*[3], but *tripack*[4] can also be used. *tripack* seems to be faster in general, but may “hang” with certain data sets (particularly regular grids with missing spectra as in this example). Furthermore, it is not FOSS (free and open source software).

gg

Mark missing spectra

If the spectra come from a rectangular grid, missing positions can be marked with this panel function:

```
> mark.missing <- function (x, y, z, ...){
+   panel.levelplot (x, y, z, ...)
+ }
+ miss <- expand.grid (x = unique (x), y = unique (y))
+ miss <- merge (miss, data.frame (x, y, TRUE),
+               all.x = TRUE)
+ miss <- miss [is.na (miss[, 3]),]
+ panel.xyplot (miss [, 1], miss [, 2], pch = 4, ...)
+ }
> plotmap (sample (chondro, 865),
+          col.regions = matlab.palette(20),
+          col = "black",
+          panel = mark.missing)
```

8 3 D (with rgl)

gg

3D plots with *rgl*

rgl[5] offers fast 3d plotting in R. As *rgl*'s axis annotations are sometimes awkward, they may better be set manually:

```
> laser <- laser [, , 404.8 ~ 405.6]
> cols <- rep (matlab.palette (nrow (laser)), nwl (laser))
> surface3d (y = wl (laser), x = laser$t,
+           z = laser$spc, col = cols)
> aspect3d (c (1, 1, 0.25))
> axes3d (c ('x+-', 'y--', 'z--'))
> axes3d ('y--', nticks = 25, labels = FALSE)
> mtext3d ("t / s", 'x+-', line = 2)
> mtext3d ("lambda / nm", 'y--', line = 2)
> mtext3d ("I / a.u.", edge = 'z--', line = 2.5)
```

9 Using *ggplot2* with *hyperSpec* objects

hyperSpec objects do not yet directly support plotting with *ggplot2* [6]. Nevertheless, *ggplot2* graphics

can easily be obtained.

In general, `as.long.df` transforms a *hyperSpec* object into a long-form *data.frame* that is suitable for `qplot`, `ggplot`, etc:

gg

plot spectra with as.long.df

```
> df <- as.long.df (flu, rownames = TRUE)
> ggplot (df, aes (x = .wavelength, y = spc,
+                 colour = c, groups = .rownames)) +
+   geom_line () +
+   xlab (labels (flu)$wavelength) +
+   ylab (labels (flu)$spc)
```

The two special columns `.wavelength` and `.rownames` contain the wavelength axis and allow to distinguish the spectra.

Note however, that long *data.frames* can be *very* memory consuming as they are of size $nrow \cdot nwl \times (ncol + 2)$ with respect to the dimensions of the *hyperSpec* object. Thus, e.g. the `chondro` data set (2 MB as *hyperSpec* object) needs 24 MB as long-format *data.frame*. It is therefore highly recommended to calculate the particular data to be plotted beforehand. Moreover, depending on the particular plot `as.data.frame` may be more suitable than `as.long.df`:

gg

Map with qqplot2

```
> df <- as.long.df (apply (chondro, 1, mean))
> ggplot (df, aes (x = x, y = y, fill = spc)) +
+   geom_tile () +
+   scale_fill_continuous ("spc", matlab.palette ()) +
+   scale_x_continuous (expand = c (0, 0)) +
+   scale_y_continuous (expand = c (0, 0)) +
+   coord_equal ()
```

gg

Cut spectra with qqplot2

Cut axes can be simulated by facetting. A factor is needed that indicates the respective ranges:

```
> df <- paracetamol [, , c( min ~ 1800, 2800 ~ max)] / 1e4
> df <- as.long.df (df)
> df$range <- factor (df$.wavelength > 2000)
> ggplot (df, aes (x = .wavelength, y = spc)) +
+   geom_line () +
+   facet_grid (. ~ range, labeller = function (...) "",
+               scales = "free", space = "free") +
+   scale_x_continuous (breaks = seq (0, 3200, 400)) +
+   opts (strip.background = theme_blank ())
```

10 Troubleshooting

10.1 No output is produced

`plotmap` and `plotc` use `levelplot`, a *lattice* function. Therefore, in loops, functions, Sweave chunks, etc. the lattice object needs to be printed explicitly by `print (plotmap (object))` ([R FAQ: Why do lattice/trellis graphics not work?](#)). The same holds for *ggplot2* graphics.

For suggestions how the lattice functions can be redefined so that the result is printed without external print command, see `vignettes.defs`.

11 Interactive Graphics

hyperSpec offers two basic interaction functions, `spc.identify`, and `map.identify`. They identify points in spectra plots and map plots, respectively.

11.1 `spc.identify`: finding out wavelength, intensity and spectrum

`spc.identify` allows to measure points in graphics produced by `plotspc`. It works correctly with reversed and cut wavelength axes.

```
> spc.identify (plotspc (paracetamol, wl.range = c (600 ~ 1800, 2800 ~ 3200), xoffset = 800))
```

The result is a data.frame with the indices of the spectra, the wavelength, and its intensity.

11.2 `map.identify`: finding a spectrum in a map plot

`map.identify` returns the spectra indices of the clicked points.

```
> map.identify (chondro)
```

11.3 Related functions provided by base graphics and lattice

For base graphics (as produced by `plotspc`), `locator` may be useful as well. It returns the clicked coordinates. Note that these are *not* transformed according to `xoffset` & Co.

For lattice graphics, `grid.locator` may be used instead. If it is not called in the panel function, a preceeding call to `trellis.focus` is needed:

```
> plot (laser, "mat")
> trellis.focus ()
> grid.locator ()
```

`identify` (or `panel.identify` for lattice graphics) allows to identify points of the plot directly. Note that the returned indices correspond to the plotted object.

11.4 Interactively changing graphics

hyperSpec's lattice functions work with *playwith* [7] and *latticeist* [8]. These packages allow easy customization of the plots and also identification of points.
